Some topics

- $pp \rightarrow h + \text{jets}$ fixed-order vs. matched/merged calculations
- parton shower systematics
- matching/merging systematic uncertainties
- tuning in the presence of matching/merging
- extrapolation from fiducial region to 4π
- EW corrections
- $pp \rightarrow t\bar{t} + \text{jets}$ comparison
- ...

$pp \rightarrow h + \text{jets}$

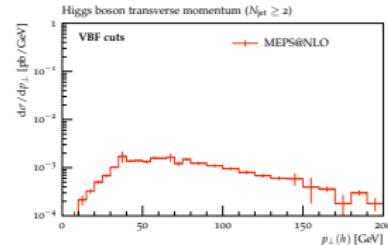

- common project with Loops and Multilegs group
- many observables have intricate phase space dependencies
→ non-trivial to see which ones are described decently by fixed-order calculations
- even when picture seems clear there are surprises
 - xs, leading jet pT in dijet production
 - + leading jet pT in $pp \rightarrow Z + 1\text{jet}$ with veto on 2nd jet
- existing RIVET routine (RIVET-2.2.1) for easy analysis
 - ready for fixed-order, merged and matched calculations
 - HEPMC or LHEF input
 - either stable Higgs or decay to photons
- compare at pQCD level

$pp \rightarrow h + \text{jets}$

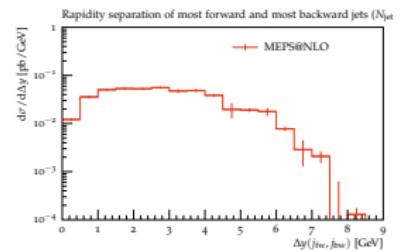

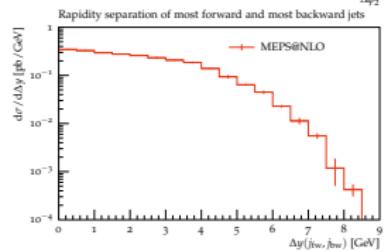

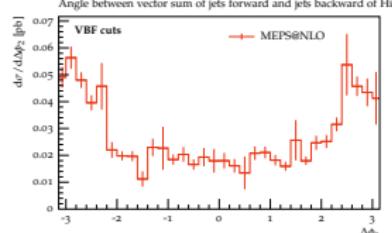

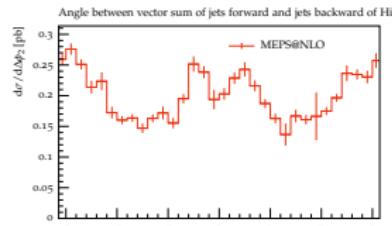

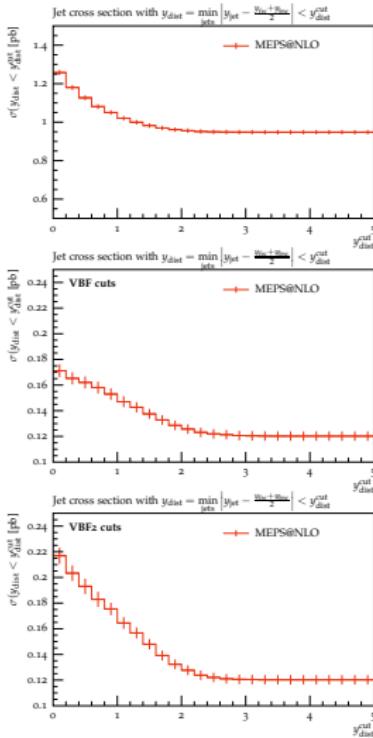

goals:

- study various observables
- some with intricate phase space dependence
- assess description

$pp \rightarrow h + \text{jets}$

goals:

- study various observables
- some with intricate phase space dependence
- assess description

Systematics

Parton showers:

- already discussed in previous incarnations of LH
- some work done by various groups
- none is exhaustive (encompasses not all arbitrary/systematic choices)
- rarely assessed in experiments

Matching/merging systematics:

- already discussed in previous incarnations of LH
- we had a nice table of what to do on the board
- rarely assessed in experiments

Non-perturbative modeling systematics:

- already discussed in previous incarnations of LH
- eigentunes, simplified variations
- rarely assessed in experiments

Extrapolation from fiducial region to 4π

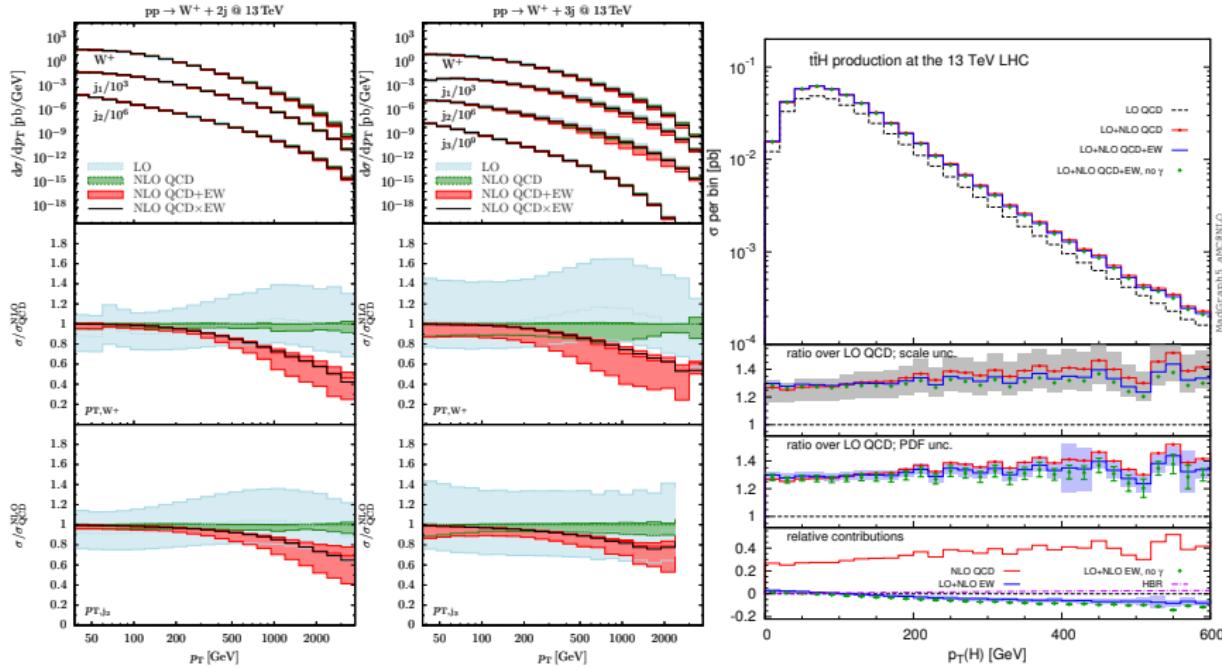

- commonly done to compare to NLO/NNLO/Resummed calculation which does not allow for fiducial cuts
- are the extrapolation uncertainties exhaustive
- when extrapolating include/not-include processes that only contribute outside fiducial region

example: Drell-Yan

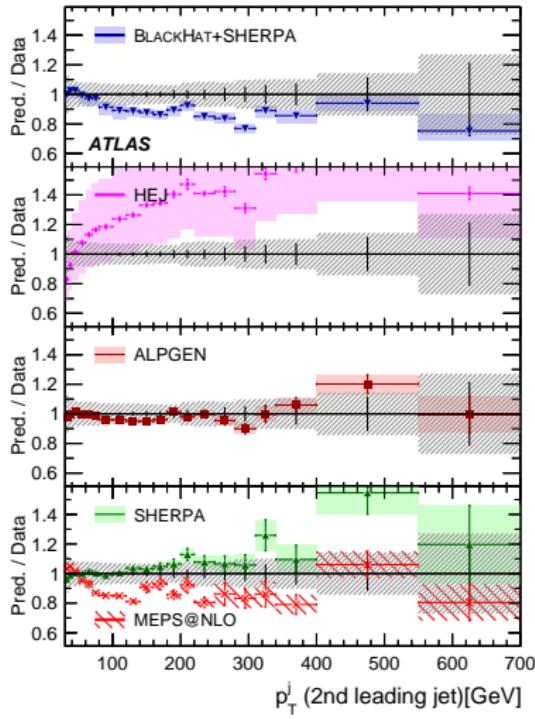

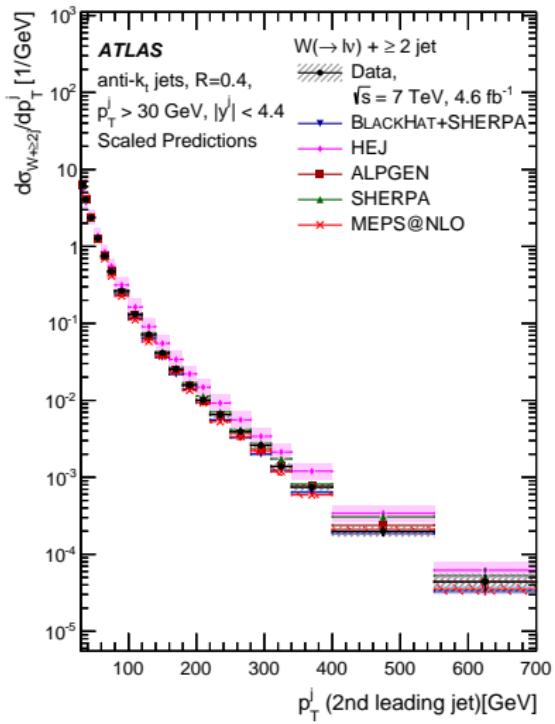

- in fiducial region $q\bar{q} \rightarrow ll$ and $\gamma\gamma \rightarrow ll$ (γ PDF)
- suppressed by orders of magnitude in fiducial region but rather large in 4π : $\gamma\gamma \rightarrow ll$ (EPA – γ -bremsstrahlung)

⇒ **Extrapolation to compare to a calculation or to describe physics process in 4π ?**

EW corrections

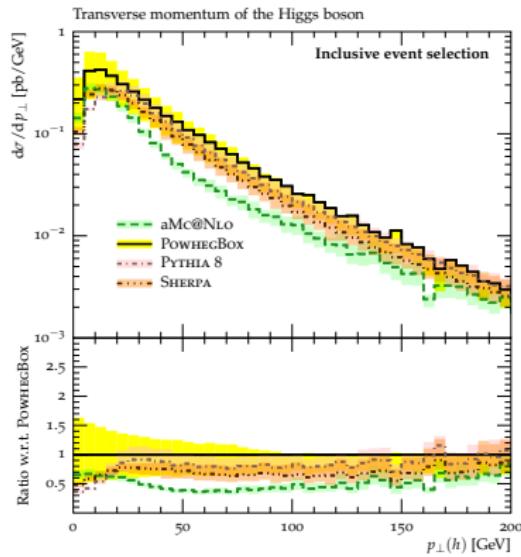

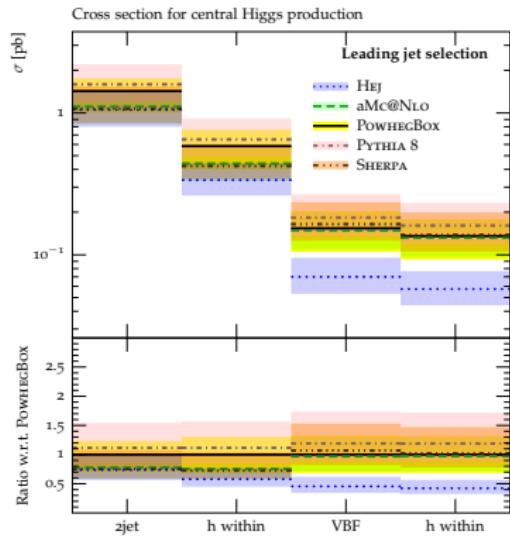

EW corrections

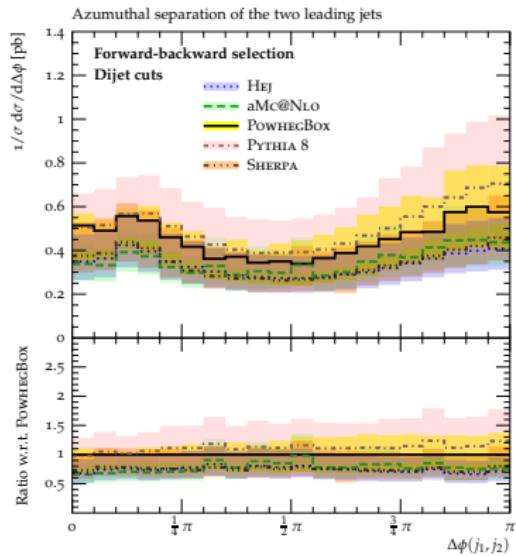

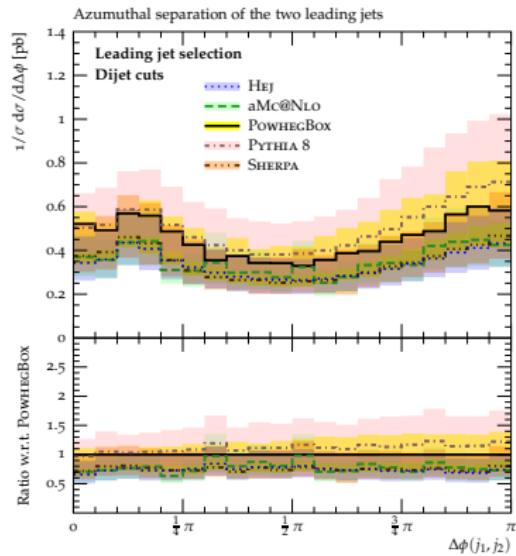

Generator comparison – $pp \rightarrow t\bar{t} + \text{jets}$

- benchmarking predictions and uncertainties of different generator/calculations
 - ideally mix of fixed-order, matched, merged
- $pp \rightarrow W + \text{jets}$ (LH'11), $pp \rightarrow h + \text{jets}$ (LH'13)
- propose $\mathbf{pp} \rightarrow \mathbf{t\bar{t}} + \text{jets}$
 - process of interest in its own right
 - background to tth and BSM
- ideally have all existing methods contributing
- should start discussing soon to fix observables etc.
- identify main objective

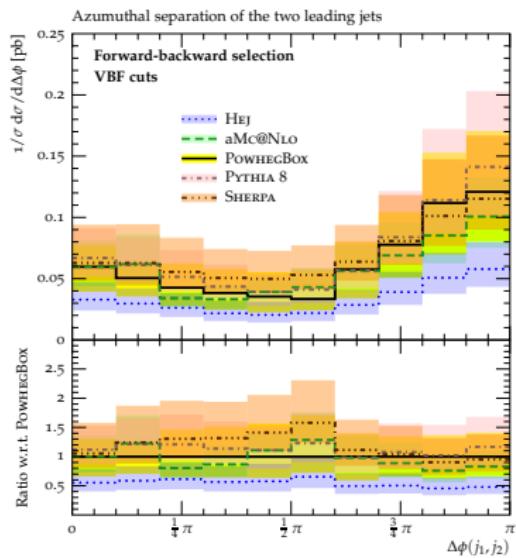

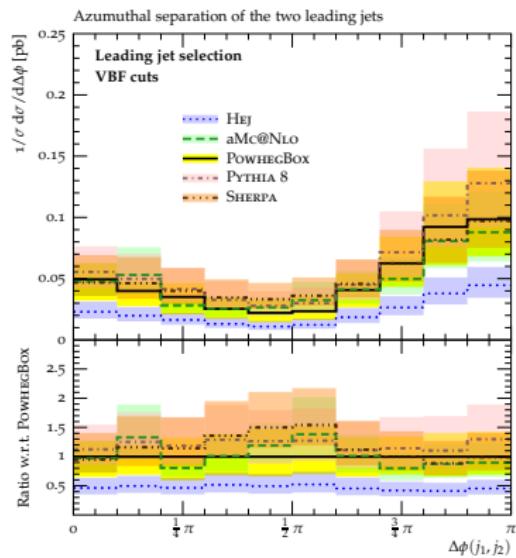

Generator comparison – $pp \rightarrow t\bar{t} + \text{jets}$

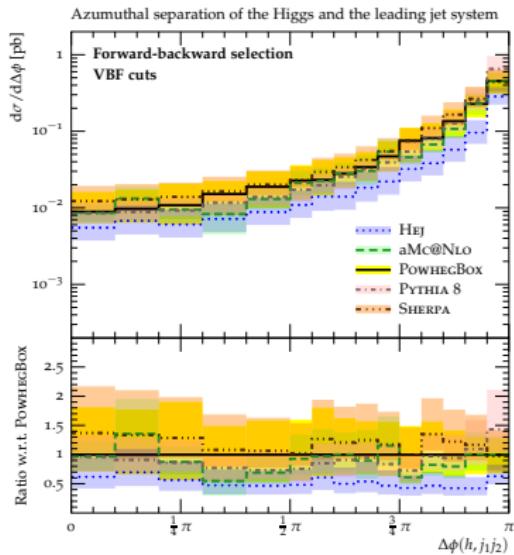

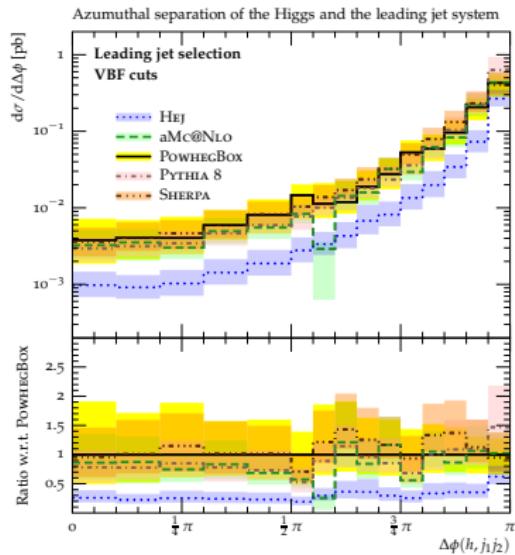

Generator comparison – $pp \rightarrow t\bar{t} + \text{jets}$

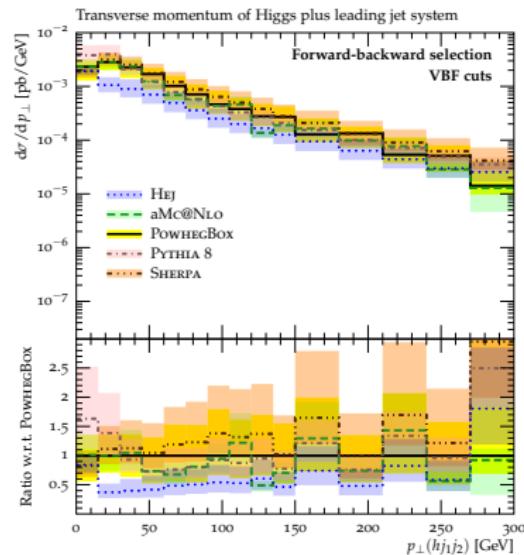

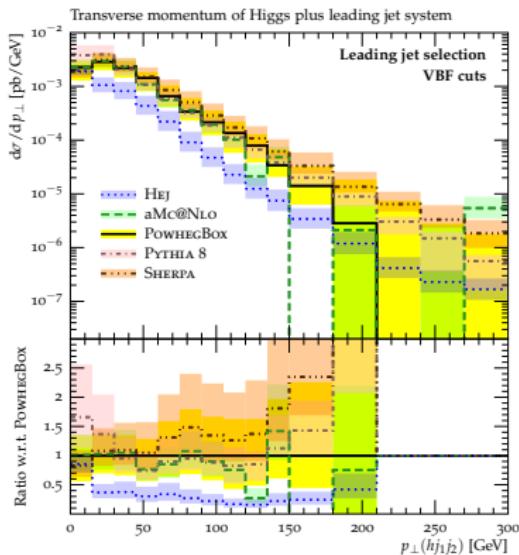

Generator comparison – $pp \rightarrow t\bar{t} + \text{jets}$

Generator comparison – $pp \rightarrow t\bar{t} + \text{jets}$

Generator comparison – $pp \rightarrow t\bar{t} + \text{jets}$

First events

Wed 14:00 – hjets discussion via Vidyo

Wed afternoonish – parton shower/matching uncertainties

Thu 10:00 – ttbar (?) setup (focus/scope/observables)

Thank you for your attention!
